

ASE6029 Linear optimal control: Homework #2

- 1) *A system with mixed eigenvalues.* Consider a linear dynamical system $\dot{x} = Ax$ with $x \in \mathbb{R}^n$ where A has mixed eigenvalues such that

$$\Re \lambda_1 < 0, \dots, \Re \lambda_s < 0,$$

for some $s < n$ and

$$\Re \lambda_{s+1} > 0, \dots, \Re \lambda_n > 0.$$

Let v_i and w_i be the (right) eigenvector and the left eigenvector associated with the i -th eigenvalue, λ_i , that is,

$$Av_i = \lambda_i v_i \quad \text{and} \quad w_i^T A = \lambda_i w_i^T.$$

- a) Show that $x(t)$ for an arbitrary initial state $x(0)$ is given by:

$$x(t) = \sum_{i=1}^n e^{\lambda_i t} v_i w_i^T x(0)$$

- b) Show that $x(t) \rightarrow 0$ as $t \rightarrow \infty$ if

$$w_i^T x(0) = 0, \quad \text{for } i = s+1, \dots, n.$$

- c) Show that the above condition is equivalent to the following.

$$x(0) \in \mathbf{span}\{v_1, \dots, v_s\}.$$

In other words, $x(t) \rightarrow 0$ as $t \rightarrow \infty$ in this case.

- 2) *Formation flight.*
